

HR70 Antenna Suggestions

The picture to the right shows the wire antenna that is included with a Rolls HR70 FM transmitter taped to a non-metallic support (wood). Having the wire straight and extended as high as possible will give the best range. Using a longer BNC cable will let you put the transmitter further from the antenna, at the cost of greater signal loss. Putting the transmitter near the antenna will give the greatest signal output.

We have tested this arrangement outdoors to give a usable radius of 250 ft. or so, but your setup may vary.

This shows the analysis scan of the supplied antenna wire.
